Soil parameterization
Posted by hchen - 2009/06/08 21:24

———————————————————

I am trying to run the soil parameterization for a watershed covering three states(Arizona, Utah and Nevada). The questions are (1) Do I need to run the stastgo soil map for each state indivually or I need to append these three states' stastgo soil maps into one soil map. (2) which database I should select? By the way, I am using AGWA2.0 with ARCGIS 9.3. Thanks!

You need to merge the three states' shapefiles together into one file. You will also need to import the tabular data from each state into the same Access database. The database should be provided with each states' soil download in the soildb_us_2002.zip file. The database provided with the download should be the same for each state and is empty, so it shouldn't matter which one you pick to use, just make sure you run the Import macro once for each state with the same database.

You can read more about the importing in this post.
